Milestone 3 - vCenter

> 💡 Milestone 1 and 2 should be completed, we are going to augment our architecture further by deploying vCenter and adding our esxi host to it.

Resources

- [vcenter8 build demo video](#)

Requirements

The rough steps you will take, document and test include:
- Download the vCenter to your datastore
- Run the installer on xubuntu-wan
- Create a datacenter called 480-yourname
- Add your superX esxi system to your datacenter as a host

Deliverables

- Take a quick demo video that shows the running VMs within your 480-yourname datacenter. Upload this video in your text submission or provide a link to your video hosted on google drive or github.
- Include in your video a walk through of your
  - Detailed configuration and build steps to include links to any configuration files you need to generate.

Grading Criteria.

You must meet all the requirements to move on, this includes comprehensive and professional documentation and journaling.
